

# BOBCAT FALL TRITICALE

**Bobcat** is a high-yielding forage triticale that has reduced awn expression, which means it has very short, almost non-existent beards. It has been widely adapted to all areas of North America for use as grazing, silage, greenfeed and now recently as a base for cover crop cocktail mixes.

Reduced awn expression is a feature of this variety that is popular with cattlemen who are concerned about lumpjaw.

It is very winter hardy making it suitable for areas that experience wide temperature fluctuations during the dormant period. It's winter survivability is much greater than that of winter wheat making it an ideal choice for areas west of the Rockies that experience Chinook winds throughout the winter.

Lodging resistance is excellent which makes **Bobcat** fall triticale ideally suited to irrigation or higher rainfall areas.

**Bobcat** boasts a disease resistance to Leaf and Stem Rust.
