ORe BOOST Forage Oat

Progress Through Research
Le progrès grâce à la recherche

ORe BOOST is a late maturing forage oat with good straw strength and excellent forage yield potential. These qualities should allow ORe BOOST to be a great fit with annual forage producers across western Canada.

Strengths:

- Late maturity ideal in a forage oat
- Improved forage yield potential over older forage oat varieties
- Improved straw strength over older forage oat varieties
- Very upright leaves allowing sun to penetrate canopy and maximize yield
- Plant tillers extensively producing finer stems that still maintain good straw strength leading to higher tonnage, and higher total digestible fibre
- Grain yield more comparable to milling and pony oats (much higher than CDC Haymaker)
- Grain is mostly awnless and very plump for easier harvest and cleaning
